SCHEDULE 3

Determining Quantitative status of Groundwater

- 1.—(1) The Department must determine the quantitative status of a body of groundwater as follows—
 - (a) by determining whether or not one or more of the indicators in Column 1 of Table 1 are applicable to the body of groundwater; and
 - (b) if any of those indicators are applicable, by carrying out appropriate investigations to determine whether or not the criteria in Column 2 of Table 1 corresponding to the applicable indicator or indicators for poor quantitative status are satisfied.
 - (2) The body of groundwater must be classified as—
 - (a) "good groundwater quantitative status" where—
 - (i) none of the indicators set out in Column 1 of Table 1 are applicable, or
 - (ii) one or more of those indicators are applicable but none of the corresponding criteria for poor groundwater status set out in Column 2 of Table 1 are satisfied; and
 - (b) in any other case as "poor groundwater quantitative status".

Table 1

Risk indicators and classification criteria for groundwater quantitative status

Column 1 Column 2 Saline or other intrusions into a groundwater Significant and sustained upward i) trend in electrical conductivity body: indicating saline intrusion; a) Failure of a threshold value i.e. electrical conductivity for groundwater as derived ii) Significant and sustained upward in accordance with the Groundwater trend in the concentration of other Regulations (Northern Ireland) 2009; or indicators of intrusion; b) Other indications of intrusions of poor Existing evidence that a point iii) quality water into the body of groundwater of abstraction has been rendered unsuitable for use without prior (Note: "intrusion" is interpreted to be intrusion of treatment as a result of an intrusion. poor quality water into a groundwater body from another water body, rather than the movement of a plume of poor quality water within the body). **Surface water:** Flow conditions are preventing the a) Flow conditions in an associated surface surface water body maintaining water body are unsatisfactory, and there or achieving the target status class is reason to suspect that groundwater and the reduction in river flow in abstraction impacts (on the surface water the surface water body concerned body) are a significant component of the (resulting solely from groundwater failure to achieve flow standards. abstraction) represents ≥50% of the value of the allowable abstraction (Note: Flow conditions are considered (based on the flow standards). unsatisfactory if they are failing to meet the appropriate WFD flow standards and in doing so, preventing the surface water body maintaining of achieving its target status class).

Column 1		Column 2	
Groundwater Dependant Terrestrial Ecosystems (GWDTE): a) Indications of damage to a GWDTE caused by insufficient water availability identified		i) A significant proportion of the departure from the predefined environmental supporting conditions can be attributed to anthropogenic	
	through the departure from predefined environmental supporting conditions, including flow and groundwater level (or chemistry) which are required to maintain dependent communities in a favourable state.	quantitative groundwate	e pressures in the er body, affecting er availability to the
Wata)	Indications that the total annual volume of groundwater being abstracted from the groundwater body exceeds the long term annual average rate of recharge to the groundwater body (taking in to account an allowance where relevant for dependent ecosystems).	roundwater book he long-term echarge to the grander are sustained tree	ual average volume a abstracted from the dy represents more than annual average rate of roundwater body and there ends of long term falling els within the groundwater
