## SCHEDULE 5

## CRITERIA FOR DETERMINING MINIMUM NUMBERS OF SAMPLING POINTS FOR FIXED MEASUREMENT OF CONCENTRATIONS OF RELEVANT POLLUTANTS AND OZONE IN AMBIENT AIR

## PART II

Relevant pollutants: minimum number of sampling points for fixed measurements to assess compliance with limit values for the protection of ecosystems or vegetation in zones other than agglomerations

| If maximum concentrations exceed the upper <br> assessment threshold | If maximum concentrations are between the <br> upper and lower assessment thresholds |
| :--- | :--- |
| 1 station every $20,000 \mathrm{~km}^{2}$ | 1 station every $40,000 \mathrm{~km}^{2}$ |

In island zones the number of sampling points for fixed measurement should be calculated taking into account the likely distribution patterns of ambient-air pollution and the potential exposure of ecosystems or vegetation.
